

Product Overview

1 Advantages Of The ISM-Software-Concept

After many years of experience **ISM** has decided to develop a new software tool. The main design objectives of this tool have been the inclusion of industry standards wherever possible and an overall cost efficiency. The main advantages of the **ISM** software concept are:

- **Cost Reduction**
- **Extended Software Life Cycle**
- **Industry Standard Components**

1.1 Cost Reduction

First of all, our customers only have to bear the license fees for the **Oracle®-Database**. In software projects, **ISM** provides the software tool **ISM*WebForms** by including a one-time fee without maintenance charges. No additional fees for transaction processing software tools have to be taken care of.

1.2 Extended Software Life Cycle

The availability of our own tool influences the life cycle of our software projects to a large extent. The experiences of the last 15 years have shown that software tool providers release new versions of their tools about every 3 years. New releases not only include additional license fees but also personal costs created by migration and test activities.

1.3 Industry Standard Components

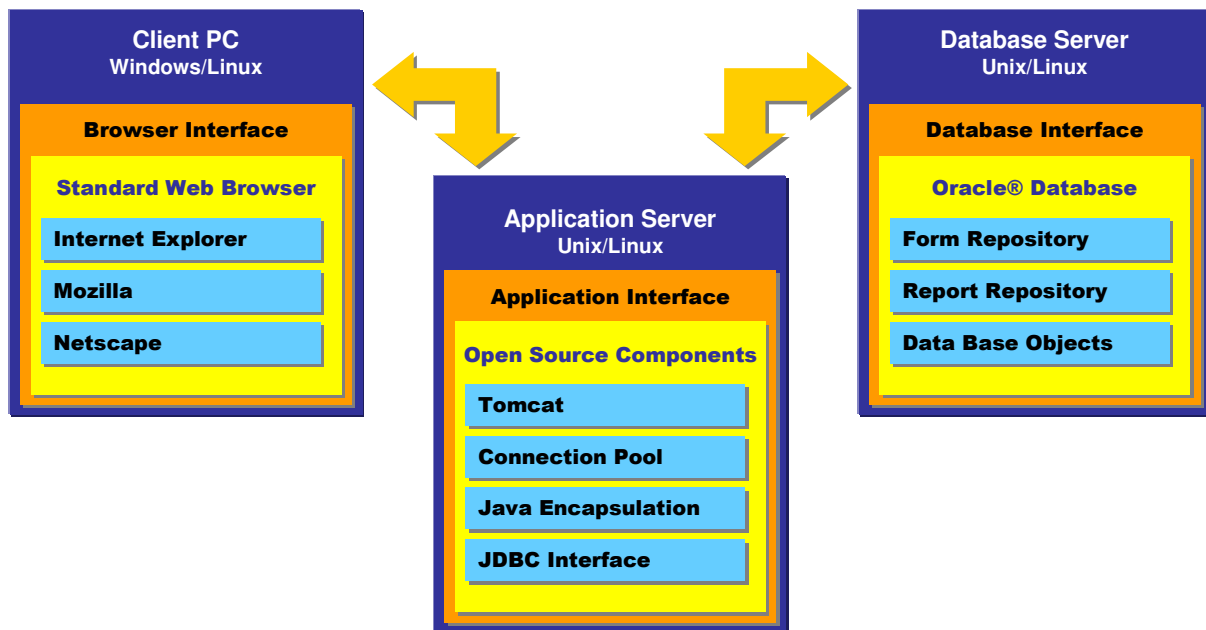

We have decided to use the **ORACLE® Database** as the leading product for storing data. This proven database is not only used to store **data** but also the **business critical methods**. Especially in this area we want to rely on the proven concepts of the market leader. Yet our open concept allows the integration of new technologies as soon as they have turned out to be reliable. The other components of our software tool either are **OpenSource** components or provided by **ISM**.

The essential point is that we are able to control the various components software technology to a large extent.

2 Technological Overview

The following picture provides a technological overview of our concept:

For the explanation of the various components please read the **ISM*WebForms** Technology Overview data sheet.
